Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

Field of the Invention

[0001] The present invention relates to a telecommunications connecting panel and, more particularly, to a cross-connect patch panel including a frame with jacks on one side and wire termination locations on an opposite side.

Background of the Invention

[0002] Local area networks and telecommunications connections often use patch panels, especially at the customer's premises to enable cross-connection between telecommunications equipment. Patch panels typically include front and rear connection locations. The rear connections are typically a more permanent type of connection, such as insulation displacement connectors to connect to copper based, twisted pair telecommunications cable. The front connections of the patch panel may include any of a variety of jacks for receipt of a plug of a patch cord or other transmission cable. The jack and plug allows fairly rapid connection and disconnection between two jacks in the same patch panel, or between one jack in the patch panel and another jack in a nearby patch panel, with the patch cord. One type of jack and plug arrangement for a patch panel is an RJ45 type connector. US Patent No. 5,639,261 is an example of a cross-connect panel including rear insulation displacement connectors, and front connector jacks for receiving plugs of patch cords.

[0003] There is an increasing need for cable management in order to protect and organize the various cables. One area where damage and/or loss of performance may occur with copper based, twisted pair cables is when excessive bending of the cable occurs. This is especially a concern as higher frequencies are used, such as category 5 and greater. Falling below minimum bend radii of the cables can adversely affect performance with the transmission of signals through the copper wire patch cords. Therefore, there is a need for patch panels which address the cable management concerns noted above.

Summary of the Invention

[0004] According to one aspect of the invention there is provided a telecommunications patch panel comprising:

a connector module having a front face and an opposite facing rear face, the front face of the connector module including a connector jack for receiving a plug of a first conductive wire, the rear face including a connection location for connecting to a second conductive wire, the connection location electrically connected to the connector jack, the connector

module defining an axis of rotation generally parallel to the front face;

a frame member having a front face, the connector module rotatably mounted to the frame member for movement about the rotation axis, wherein the front face of the connector module is positionable in at least one of three selectable positions, a first position where the front face of the connector module is generally parallel to the front face of the frame member, a first angled position where the front face of the connector module is at a first angle relative to the front face of the frame member, and a second angled position where the front face of the connector module is at a second angle relative to the front face of the frame member in an opposite direction to the first angled position.

[0005] According to another aspect of the invention there is provided a telecommunications patch panel comprising:

a plurality of connector modules, each connector module having a front face and an opposite facing rear face, each front face including a plurality of connector jacks defining at least one linear array, each rear face including a plurality of cable connection locations, the cable connection locations connected to the connector jacks for transmission of telecommunications signals therebetween, each connector module defining an axis of rotation generally parallel to the front face, the linear arrays of connector jacks generally perpendicular to the respective rotation axes of the connector modules;

a frame member having a front face and a linear array of openings, each of the connector modules mounted to the frame member in one of the openings for rotatable movement about the respective rotation axes.

[0006] According to a further aspect of the invention there is also provided a telecommunications patch panel comprising:

a plurality of connector modules, each connector module including at least one linear array of front connector jacks, each connector jack connected to a rear connection location;

a frame member having a front face defining a front plane, the connector modules mounted to the frame member, each of the linear arrays of the connector jacks defining a line from a first connector jack of the linear array to a last connector jack of the linear array, each line positioned at an angle relative to the front plane of the front face.

[0007] The invention also provides a method for assembling a telecommunications patch panel comprising:

providing a frame member including a plurality of connector modules, each connector module having a front face and an opposite facing rear face, each front including a plurality of connector jacks defining at least one linear array, each rear face including a plurality of connection locations, the connection locations electrically connected to the connector jacks, each connector module defining an axis of rotation generally parallel to the front face, the linear arrays of the connector jacks generally perpendicular to the respective rotation axes; mounting a cable to one of the plurality of connection locations on a selected one of the connector modules; mounting a patch cord to the connector jack on the selected connector module connected to the connection location mounted to the cable; unlocking the selected connector module from a locked condition relative to the frame member; rotating the selected connector module relative to the frame member to a rotated position; and relocking the selected connector module in a rotated position relative to the frame member.

[0008] A telecommunication patch panel including a plurality of connector modules including linear arrays of connector jacks with each jack connected to a wire termination block is also disclosed. The connector modules are mounted to a frame member where each of the linear arrays of connector jacks is positioned at an angle relative to a front face of the frame member.

Brief Description of the Drawings

[0009]

Figure 1 is an exploded perspective view of an embodiment of a patch panel and a portion of a rack for holding the patch panel in accordance with the present invention, with two connector modules angled to the left and two connector modules angled to the right when the panel is mounted to the rack horizontally;

Detailed Description of the Preferred Embodiment

[0010] Referring now to Figures 1 and 2, an embodiment of a patch panel 20 is shown for use in connecting telecommunications equipment. Patch panel 20 is especially useful to cross-connect equipment through one or more of patch panels 20 or other panels. Patch panel 20 mounts to a rack 22 of conventional construction, such as with fasteners 26 passing through holes 28 of patch panel 20 for receipt in holes 24 of rack 22. Patch panel 20 includes a plurality of connector jacks 30, such as RJ45 connector jacks, on a front side 21. Patch panel 20 further includes a plurality of connection locations 31, such as wire termination or connection blocks 31 mounted on an opposite rear side 23. Preferably, termination blocks 31 include 110 type insulation displacement connectors. Termination blocks 31 allow for connection of signal transmission cables 46, each containing a plurality of conductive wires 48. Connector jacks 30 allow for connection of signal transmission patch cables or cords 44 including conductive wires and further including connector end plugs 42. Circuitry electrically connects each termination block 31 to a connector jack 30.

[0011] Patch panel 20 includes a plurality of connector modules 32, where each connector module 32 includes a plurality of connector jacks 30. The connector modules 32 of patch panel 20 are arranged in a linear array. Each connector module 32 includes a linear array of connector jacks 30. One linear array of jacks 30 is shown per connector module 32. Two or more arrays could be provided. Alternative embodiments include patch panels 20 with a single connector module 32. Also, each connector module 32 may be constructed with a single connector jack 30.

[0012] As shown in Figures 1 and 2, each connector module 32 is mounted in an angled orientation relative to frame 34. Specifically, frame 34 includes a front plane

or face 36, and each connector module 32 includes a front plane or face 37 where each front face 37 of the connector modules 32 is at an angle relative to front face 36 of frame 34. Connector modules 32a, 32b are angled to the left of frame 34, and connector modules 32c, 32d are angled to the right. Alternatively stated, connector modules 32a, 32b are angled clockwise, and connector modules 32c, 32d are angled counterclockwise, as viewed from a top of frame 34 as depicted in Figure 2. If patch panel 20 was oriented vertically, then connector module 32a, 32b would be angled upwardly (or downwardly), and connector modules 32c, 32d would be angled downwardly (or upwardly).

[0013] In the illustrated preferred embodiment, the angle of displacement of each connector module 32 relative to frame 34 is about 15 degrees. In the case of patch cords 44a, 44b angled to the left, and patch cords 44c, 44d angled to the right, such an angle provides strain relief so as to help prevent cable damage and/or loss of cable performance. The cable positioning provided by the angled connector modules 32 helps reduce the likelihood of falling below the minimum bend radius of the cable as each cable travels to other jacks or other equipment. Such strain relief is advantageous over a perpendicular mounting of the connector plug relative to the cable pathway, such as illustrated in Figure 4.

[0014] Figures 3 and 4 are provided to illustrate advantageous features of patch panel 20 in accordance with the invention. Preferably, connector modules 32 are rotatable relative to frame 34. In Figures 3 and 4, each connector module 32 has its front face 37 positioned generally parallel to front face 36 of frame 34. Such an arrangement is useful when using a termination tool (not shown) to mount wires 48 to each of termination blocks 31 in the case of insulation displacement connectors. A lock 40, shown generally in Figures 1 and 2, holds each connector module 32 to frame 34 during the termination operation. Lock 40 is releasable to allow rotation of each connector module 32 as desired. As shown in Figures 1 and 2, connector modules 32a, 32b are rotated to the left, and connector modules 32c, 32d are rotated to the right. One or more connector modules 32 can be left in the positions shown in Figures 3 and 4, if desired. Alternatively, all the connector modules 32 can be rotated to the left as shown in Figure 5, or to the right as shown in Figure 6. To maintain the connector modules in the rotated positions, lock 40 is reactivated. If desired, one or more of the connector modules 32 and frame 34 can be constructed in a permanently angled configuration relative to front face 36 frame 34.

[0015] In Figures 2 and 4, cables 44 are shown as being directed away from patch panel 20. It is to be noted that the opposite ends of cables 44 can be connected to other connector jacks 30 of patch panel 20. Also, patch panel 20 is useable in both cross-connect systems, and in inter-connect systems, as desired. Providing strain relief so as to not fall below minimum bend radii is also an issue with fiberoptic transmission cables.

The telecommunications patch panel 20 of the present invention is also useful in fiber applications with appropriately configured fiberoptic connectors.

[0016] Lock 40 is a preferred feature for patch panel 20. However, a patch panel 20 where the lock is not activated, or a patch panel 20 where no lock is present are both advantageous arrangements. In those instances, each connector module 32 is positionable to the left (fully or partially), to the right (fully or partially) or parallel as desired. For connector modules which are freely rotatable, the modules 32 may move to a new position from an original position to provide the strain relief, as the patch cords 44 are added or changed.

[0017] Referring now to Figures 7 through 17, additional details of patch panel 20 are shown. Each connector module 32 includes pins 50 extending in opposite directions and defining a rotation axis 52 (see Figure 11). Each rotation axis 52 is generally perpendicular to the linear array defined by connector jacks 30. Pins 52 are received in holes 54 of frame 34. The rotatable mounting of each connector module 32 to frame 34 could also be accomplished with a fastener passing through holes 54.

[0018] Frame 34 generally includes a top portion 34a and an opposing bottom portion 34b. End bracket portions 34c, 34d on opposite ends of frame 34 include rack mounting holes 28 noted above. End struts 34e are continuous with end bracket portions 34c, 34d. Middle struts 34f extend between top and bottom portions 34a, 34b. Struts 34e, 34f and top and bottom portions 34a, 34b define a linear array of openings for each receiving a connector module 32. Holes 54 of frame 34 are positioned in top and bottom portions 34a, 34b for holding the independently rotatable connector modules 32 about each respective rotation axis 52. The rotation axes 52 extend transversely relative to the linear arrays of connector jacks 30, and also a linear array defined by the plurality of connector modules 32.

[0019] A plurality of locking pins 60, and brackets 76 are mounted to frame 34. Each locking pin 60 includes a shaft 62, two spaced apart tabs 64, 66, a first tool engageable end 68, and an opposite end 70. Each tab 64, 66 has two ends extending in opposite directions. End 70 is received in hole 56 in a respective end or middle strut 34e, 34f. Tool engageable end 68 is received in an aperture 80 of bracket 76. Bracket 76 is mounted to top and bottom portions 34a, 34b of frame 34 with two fasteners 82 positioned through apertures 58. Each fastener 82 is received in a hole 78 of bracket 76. Once brackets 76 are mounted to frame 34, locking pin 60 is rotatable between an unlocked position, and a locked position. The locked position is shown in the Figures. The unlocked position is where shaft 62 is rotated 90 degrees about its longitudinal axis, such as with a flathead screwdriver received in tool engageable end 68.

[0020] Each connector module 32 includes detents 84, 86 on each end. Lock 40 is constructed wherein tabs 64, 66 are received in detents 84, 86 when connector

module 32 is locked in the position shown in Figure 3. When connector modules 32 are rotated out of plane 36 of frame 34, only one tab 64, 66 is received in one of detents 84, 86. When lock 40 is rotated 90 degrees from the position shown in the Figures, none of tabs 64, 66 are received in any of detents 84, 86 so as to allow free rotation of connector modules 32. Locks 40 associated with middle struts 34f of frame 34 each lock two adjacent connector modules 32.

[0021] Each connector module 32 includes a circuit module 90 and a face plate 92. Circuit module 90 includes a printed circuit board 94 having a generally planar construction. As shown in Figure 17, pins 96 of each termination block 31 project through printed circuit board 94 and are soldered to the board. As shown in Figure 15, connector jacks 30 include pins 98 projecting through printed circuit board 94, and the pins are soldered to the board. Connector jacks 30 also include two tabs 102 which snap mount to printed circuit board 94 through apertures 100 as shown in Figure 15. Printed circuit board 94 includes circuit pathways to electrically link each connector jack 30 with one of the termination blocks 31. Connector jacks 30 are shown in the Figures with the clip receiving portion of the jack facing vertically downwardly.

[0022] Face plate 92 preferably snap mounts to circuit module 90. Opposite ends 110 of face plate 90 include inner snaps 112 for snap fitting engagement of an edge of printed circuit board 94. (See, for example, Figure 12). Such a construction allows for repair or replacement of circuit module 90 or face plate 92, as desired.

[0023] Face plate 92 includes a central opening 108 for exposing connector jacks 30. Face plate 92 further includes outwardly facing stops 114 on each end 110 which limit the amount of rotation of connector module 32 during use. Each stop 114 engages one edge 116 of bracket 76 so as to limit the amount of rotation of connector module to approximately plus or minus 15 degrees in the preferred embodiment. Each face plate includes a front designation strip area 120 for labeling of connector jacks 30.

[0024] Examples of connector jacks 30 and termination blocks 31 are shown in U.S. Patent Nos. 5,700,167; 5,674,093; 5,639,261; 5,591,045; 5,310,363; 5,299,956; and 3,611,264.

Claims

1. A telecommunications patch panel (20) comprising:

a connector module (32) having a front face (33) and an opposite facing rear face, the front face of the connector module including a connector jack (30) for receiving a plug of a first conductive wire, the rear face including a connection location (31) for connecting to a second conductive wire, the connection location (31)

electrically connected to the connector jack (30), the connector module (32) defining an axis of rotation generally parallel to the front face; a frame member (34) having a front face (36), the connector module (32) rotatably mounted to the frame member for movement about the rotation axis, wherein the front face (37) of the connector module (32) is positionable in at least one of three selectable positions, a first position where the front face (37) of the connector module (32) is generally parallel to the front face (36) of the frame member (34), a first angled position where the front face (37) of the connector module (32) is at a first angle relative to the front face (36) of the frame member (34), and a second angled position where the front face (36) of the connector module (32) is at a second angle relative to the front face (36) of the frame member (34) in an opposite direction to the first angled position.

2. The telecommunications patch panel of claim 1, further comprising brackets (34c, 34d) extending from the frame member (34) for mounting to a rack (22).

3. The telecommunications patch panel of claim 1 or claim 2, further comprising a lock (40) for selectively locking the connector module (32) to the frame member (34) in one of the three selectable positions.

4. The telecommunications patch panel of any one of claims 1 to 3, further comprising a plurality of the connector jacks (30), wherein the plurality of connector jacks (30) are arranged in a linear array generally perpendicular to the axis of rotation.

5. The telecommunications patch panel of claim 4, further comprising a plurality of connector modules (32), each of the plurality of connector modules (32) including a plurality of the connector jacks (30), the connector modules (32) arranged in at least one linear array.

6. The telecommunications patch panel of any one of claims 1 to 3, further comprising a plurality of connector modules (32).

7. The telecommunications patch panel of any preceding claim, wherein the or each connector jack (30) is an RJ45 jack.

8. The telecommunications patch panel of any preceding claim, wherein the or each connection location (31) is a wire termination block.

9. The telecommunications patch panel of any preceding claim, wherein the or each connector mod-

ule (32) includes a printed circuit board (94), a face plate (92) and a snap arrangement for snap fitting the face plate to the printed circuit board, the connector jack or jacks (30) mounted to the printed circuit board (94) on one side of the printed circuit board, the connection location (31) including an insulation displacement connector mounted to the printed circuit board (94) on an opposite side to the connector jack or jacks (30), the face plate (92) including an opening for exposing the connector jack or jacks (30).

10. A telecommunications patch panel (20) comprising:

a plurality of connector modules (32), each connector module having a front face (37) and an opposite facing rear face, each front face including a plurality of connector jacks (30) defining at least one linear array, each rear face including a plurality of cable connection locations (31), the cable connection locations connected to the connector jacks (30) for transmission of telecommunications signals therebetween, each connector module (32) defining an axis of rotation generally parallel to the front face, the linear arrays of connector jacks generally perpendicular to the respective rotation axes of the connector modules;
a frame member (34) having a front face (36) and a linear array of openings, each of the connector modules (32) mounted to the frame member (34) in one of the openings for rotatable movement about the respective rotation axes.

11. The telecommunications patch panel of claim 10, wherein each of the connector modules (32) is positionable in at least one of three selectable positions, a first position where the front face (37) of the connector module (32) is generally parallel to the front face (36) of the frame member (34), a first angled position where the front face (37) of the connector module (32) is at a first angle relative to the front face (36) of the frame member (34), and a second angled position where the front face (37) of the connector module (32) is at a second angle relative to the front face (36) of the frame member (34) in an opposite direction to the first angled position.
12. The telecommunications patch panel of claim 10 or claim 11, further comprising brackets (34c, 34d) extending from the frame member (34) for mounting to a rack (22).
13. The telecommunications patch panel of any one of claims 10 to 12, further comprising a lock (40) for selectively locking the connector module to the frame member.

14. The telecommunications patch panel of claim 13, wherein at least one lock locks two adjacent connector modules to the frame member (34).

15. The telecommunications patch panel of any one of claims 10 to 14, wherein the connector jacks are sized to receive plugs of copper telecommunications cables, and the cable connection locations include wire termination blocks configured and arranged for receiving wires of copper telecommunications cables.

16. The telecommunications patch panel of any one of claims 13 to 15, and further comprising a stop (114) for limiting rotation of each of the connector modules (32) to a predetermined range of motion.

17. A telecommunications patch panel (20) comprising:

a plurality of connector modules (32), each connector module including at least one linear array of front connector jacks (30), each connector jack (30) connected to a rear connection location (31);
a frame member (34) having a front face defining a front plane (36), the connector modules (32) mounted to the frame member (34), each of the linear arrays of the connector jacks (30) defining a line from a first connector jack of the linear array to a last connector jack of the linear array, each line positioned at an angle relative to the front plane (36) of the front face.

18. The telecommunications patch panel of claim 17, wherein the connector modules (32) are rotatably mounted to the frame member (34).

19. A method for assembling a telecommunications patch panel (20) comprising:

providing a frame member (34) including a plurality of connector modules (32), each connector module (32) having a front face (37) and an opposite facing rear face, each front including a plurality of connector jacks (30) defining at least one linear array, each rear face including a plurality of connection locations (31), the connection locations electrically connected to the connector jacks (30), each connector module (32) defining an axis of rotation generally parallel to the front face (37), the linear arrays of the connector jacks generally perpendicular to the respective rotation axes;
mounting a cable to one of the plurality of connection locations (31) on a selected one of the connector modules (32);
mounting a patch cord to the connector jack (30) on the selected connector module (32)

connected to the connection location mounted to the cable;
unlocking the selected connector module from a locked condition relative to the frame member (34);
rotating the selected connector module relative to the frame member (34) to a rotated position; and
relocking the selected connector module in a rotated position relative to the frame member (34).

Patentansprüche

1. Telekommunikationsstecktafel (20) umfassend:

ein Verbindungsmodul (32) mit einer Vorderseite (33) und einer gegenüberliegenden Rückseite, wobei die Vorderseite des Verbindungsmoduls eine Verbindungsbuchse (30) zur Aufnahme eines Steckers eines ersten leitenden Drahtes aufweist, die Rückseite einen Verbindungsbereich (31) zur Verbindung mit einem zweiten leitenden Draht aufweist, der Verbindungsbereich (31) mit der Verbindungsbuchse (30) elektrisch verbunden ist und das Verbindungsmodul (32) eine im Wesentlichen parallel zur Vorderseite verlaufende Rotationsachse definiert;

ein Rahmenelement (34) mit einer Vorderseite (36), wobei das Verbindungsmodul (32) drehbar an dem Rahmenelement zur Bewegung um die Rotationsachse befestigt ist, wobei die Vorderseite (37) des Verbindungsmoduls (32) in mindestens einer von drei auswählbaren Positionen positionierbar ist, in einer ersten Position die Vorderseite (37) des Verbindungsmoduls (32) im Wesentlichen parallel ist zur Vorderseite (36) des Rahmenelementes (34), in einer ersten winkligen Position die Vorderseite (37) des Verbindungsmoduls (32) in einem ersten Winkel relativ zur Vorderseite (36) des Rahmenelementes (34) ist und in einer zweiten winkligen Position die Vorderseite (36) des Verbindungsmoduls (32) in einem zweiten Winkel relativ zur Vorderseite (36) des Rahmenelementes (34) in einer zur ersten winkligen Position entgegengesetzten Richtung ist.

2. Telekommunikationsstecktafel nach Anspruch 1, weiterhin umfassend Klammern (34c, 34d), die sich von dem Rahmenelement (34) zur Befestigung an einem Gestell (22) erstrecken.

3. Telekommunikationsstecktafel nach Anspruch 1 oder Anspruch 2, weiterhin umfassend einen Verschluss (40), um das Verbindungsmodul (32) geson-

dert an das Rahmenelement (34) in einer der drei auswählbaren Positionen zu verschließen.

4. Telekommunikationsstecktafel nach einem der vorhergehenden Ansprüche 1 bis 3, weiterhin umfassend eine Mehrzahl von Verbindungsbuchsen (30), wobei die Mehrzahl der Verbindungsbuchsen (30) in einer im Wesentlichen senkrecht zur Rotationsachse befindlichen linearen Anordnung angeordnet sind.

5. Telekommunikationsstecktafel nach Anspruch 4, weiterhin umfassend eine Mehrzahl von Verbindungsmodulen (32), wobei jedes der Mehrzahl der Verbindungsmodulen (32) eine Mehrzahl von Verbindungsbuchsen (30) aufweist und die Verbindungsmodulen (32) in mindestens einer linearen Anordnung angeordnet sind.

6. Telekommunikationsstecktafel nach einem der vorhergehenden Ansprüche 1 bis 3, weiterhin umfassend eine Mehrzahl von Verbindungsmodulen (32).

7. Telekommunikationssteckvorrichtung nach einem der vorhergehenden Ansprüche, wobei die oder jede Verbindungsbuchse (30) eine RJ45-Buchse ist.

8. Telekommunikationsstecktafel nach einem der vorhergehenden Ansprüche, wobei der oder jeder Verbindungsbereich (31) ein Drahtanschlußblock ist.

9. Telekommunikationsstecktafel nach einem der vorhergehenden Ansprüche, wobei das oder jedes Verbindungsmodul (32) eine gedruckte Leiterplatte (94), eine Frontplatte (92) und eine Schnappanordnung zur Schnappverbindung der Frontplatte an die gedruckte Leiterplatte aufweist, die Verbindungsbuchse oder -buchsen (30) an der gedruckten Leiterplatte (94) auf einer Seite der gedruckten Leiterplatte befestigt ist/ sind, der Verbindungsbereich (31) einen Isolierungsverstellverbinder aufweist, der an der gedruckten Leiterplatte (94) auf einer der Verbindungsbuchse oder -buchsen (30) gegenüberliegenden Seite befestigt ist, wobei die Frontplatte (92) eine Öffnung zum freien Zugang der Verbindungsbuchse oder -buchsen (30) aufweist.

10. Telekommunikationsstecktafel (20) umfassend:

eine Mehrzahl von Verbindungsmodulen (32), wobei jedes Verbindungsmodul eine Vorderseite (37) und eine gegenüberliegende Rückseite aufweist, jede Vorderseite eine mindestens eine lineare Anordnung definierende Mehrzahl von Verbindungsbuchsen (30) aufweist, jede Rückseite eine Mehrzahl von Kabelverbindungsgebieten (31) aufweist, die Kabelverbindungsgebiete mit den Verbindungsbuch-

- sen (30) zur Übertragung von Telekommunikationssignalen dazwischen verbunden sind, jedes Verbindungsmodul (32) eine im Wesentlichen parallel zur Vorderseite verlaufende Rotationsachse definiert, die linearen Anordnungen der Verbindungsbuchsen im Wesentlichen senkrecht zu den entsprechenden Rotationsachsen der Verbindungsmodule sind;
 ein Rahmenelement (34) mit einer Vorderseite (36) und einer linearen Anordnung von Öffnungen, wobei jedes der Verbindungsmodule (32) an dem Rahmenelement (34) in einer der Öffnungen zur drehbaren Bewegung um die entsprechenden Rotationsachsen befestigt ist.
11. Telekommunikationsstecktafel nach Anspruch 10, wobei jedes der Verbindungsmodule (32) in mindestens einer von drei auswählbaren Positionen positionierbar ist, in einer ersten Position die Vorderseite (37) des Verbindungsmoduls (32) im Wesentlichen parallel zur Vorderseite (36) des Rahmenelementes (34) ist, in einer ersten abgewinkelten Position die Vorderseite (37) des Verbindungsmoduls (32) in einem ersten Winkel relativ zur Vorderseite (36) des Rahmenelementes (34) ist, und in einer zweiten winkligen Position die Vorderseite (37) des Verbindungsmoduls (32) in einem zweiten Winkel relativ zur Vorderseite (36) des Rahmenelementes (34) in einer zur ersten winkligen Position entgegengesetzten Richtung ist.
12. Telekommunikationsstecktafel nach Anspruch 10 oder Anspruch 11, weiterhin umfassend Klammern (34c, 34d), die sich von dem Rahmenelement (34) zur Befestigung an einem Gestell (22) erstrecken.
13. Telekommunikationsstecktafel nach einem der Ansprüche 10 bis 12, weiterhin umfassend einen Verschluss (40) zum selektiven Verschließen des Verbindungsmoduls an das Rahmenelement.
14. Telekommunikationsstecktafel nach Anspruch 13, wobei mindestens ein Verschluss zwei nebeneinanderliegende Verbindungsmodule an das Rahmenelement (34) schließt.
15. Telekommunikationsstecktafel nach einem der Ansprüche 10 bis 14, wobei die Verbindungsbuchsen so dimensioniert sind, um Stecker von Kupfertelekommunikationskabeln aufzunehmen, und die Kabelverbindungsgebiete Drahtanschlußblöcke aufweisen, die so konfiguriert und angeordnet sind, dass sie Drähte von Kupfertelekommunikationskabeln aufnehmen können.
16. Telekommunikationsstecktafel nach einem der Ansprüche 13 bis 15, und weiterhin umfassend einen Anschlag (114) zur Begrenzung der Rotation jedes

der Verbindungsmodule (32) zu einem festgelegten Bewegungsbereich.

17. Telekommunikationsstecktafel (20) umfassend:

eine Mehrzahl von Verbindungsmodulen (32), wobei jedes Verbindungsmodul mindestens eine lineare Anordnung von vorderen Verbindungsbuchsen (30) aufweist, jede Verbindungsbuchse (30) mit einem rückseitigen Verbindungsbereich (31) verbunden ist;
 ein Rahmenelement (34) mit einer Vorderfläche (36) definierenden Vorderseite, wobei die Verbindungsmodule (32) an dem Rahmenelement (34) befestigt sind, jede der linearen Anordnungen der Verbindungsbuchsen (30) eine Linie von einer ersten Verbindungsbuchse der linearen Anordnung zu einer letzten Verbindungsbuchse der linearen Anordnung definiert und
 jede Linie an einem Winkel relativ zur Vorderfläche (36) der Vorderseite positioniert ist.

18. Telekommunikationsstecktafel nach Anspruch 17, wobei die Verbindungsmodule (32) drehbar am Rahmenelement (34) befestigt sind.

19. Verfahren zum Zusammenbau einer Telekommunikationsstecktafel (20) umfassend:

Bereitstellen eines Rahmenelementes (34), das eine Mehrzahl von Verbindungsmodulen (32) aufweist, wobei jedes Verbindungsmodul (32) eine Vorderseite (37) und eine gegenüberliegende Rückseite aufweist, jede Vorderseite eine Mehrzahl von mindestens eine lineare Anordnung definierenden Verbindungsbuchsen (30) aufweist, jede Rückseite eine Mehrzahl von Verbindungsbereichen (31) aufweist, die Verbindungsbereiche zu den Verbindungsbuchsen (30) elektrisch verbunden sind, jedes Verbindungsmodul (32) eine zur Vorderseite (37) im Wesentlichen parallele Rotationsachse definiert, die linearen Anordnungen der Verbindungsbuchsen im Wesentlichen senkrecht zu den entsprechenden Rotationsachsen sind;
 Befestigen eines Kabels an einer der Mehrzahl von Verbindungsbereichen (31) auf einem Ausgewählten der Verbindungsmodule (32);
 Befestigen einer Steckschnur an die Verbindungsbuchse (30) auf dem ausgewählten Verbindungsmodul (32), das mit dem an dem Kabel befestigten Verbindungsbereich verbunden ist;
 Entriegeln des ausgewählten Verbindungsmoduls aus einer verriegelten Lage relativ zum Rahmenelement (34);
 Drehen des ausgewählten Verbindungsmoduls

relativ zum Rahmenelement (34) zu einer gedrehten Position; und
Wiederverschließen des ausgewählten Verbindungsmoduls in einer gedrehten Position relativ zum Rahmenelement (34).

Revendications

1. Panneau de raccordement de télécommunications (20) comprenant :
 - un module de connecteurs (32) ayant une face avant (33) et une face arrière opposée, la face avant du module de connecteurs incluant un récepteur de connecteur (30) pour recevoir une fiche d'un premier fil conducteur, la face arrière incluant un emplacement de connexion (31) pour connecter un second fil conducteur, l'emplacement de connexion (31) électriquement relié au récepteur de connecteur (30), le module de connecteurs (32) définissant un axe de rotation généralement parallèle à la face avant ;
 - un cadre d'accueil (34) ayant une face avant (36), le module de connecteurs (32) montés sur pivot au cadre d'accueil pour un mouvement autour de l'axe de la rotation, dans lequel la face avant (37) du module de connecteurs (32) est positionnable dans au moins une position parmi trois, une première position où la face avant (37) du module de connecteurs (32) est généralement parallèle à la face avant (36) du cadre d'accueil (34), une première position orientée où la face avant (37) du module de connecteurs (32) est à un premier angle par rapport à la face avant (36) du cadre d'accueil (34), et une seconde position orientée où la face avant (36) du module de connecteurs (32) est à un second angle par rapport à la face avant (36) du cadre d'accueil (34) dans une direction opposée à la première position orientée.
2. Panneau de raccordement de télécommunications selon la revendication 1, comprenant en outre des supports (34c, 34d) sortant du cadre d'accueil (34) pour un montage en rack (22).
3. Panneau de raccordement de télécommunications selon la revendication 1 ou 2, comprenant en outre un verrouillage (40) pour bloquer sélectivement le module de connecteurs (32) au cadre d'accueil (34) dans l'une des trois positions pouvant être choisies.
4. Panneau de raccordement de télécommunications selon l'une quelconque des revendications 1 à 3, comprenant en outre une pluralité de récepteurs de connecteur (30), où la pluralité de récepteur de connecteur (30) est organisé en groupement linéaire généralement perpendiculaire à l'axe de rotation.
5. Panneau de raccordement de télécommunications selon la revendication 4, comprenant en outre une pluralité de modules de connecteurs (32), chacun de la pluralité de modules de connecteurs (32) comprenant une pluralité de récepteurs de connecteur (30), les modules de connecteurs (32) organisés dans au moins un groupement linéaire.
6. Panneau de raccordement de télécommunications selon l'une quelconque des revendications 1 à 3, comprenant en outre une pluralité de modules de connecteurs (32).
7. Panneau de raccordement de télécommunications selon l'une quelconque des revendications précédentes, dans lequel un ou chaque récepteur de connecteur (30) est un récepteur RJ45.
8. Panneau de raccordement de télécommunications selon l'une quelconque des revendications précédentes, dans lequel un ou chaque emplacement de connexion (31) est un bloc de terminaison de fil.
9. Panneau de raccordement de télécommunications selon l'une quelconque des revendications précédentes, dans lequel un ou chaque module de connecteurs (32) inclut une carte à circuit imprimé (94), une plaque de face (92) et un système d'ajustage pour ajuster la plaque de face à la carte à circuit imprimé, le ou les récepteurs de connecteur (30) monté à la carte à circuit imprimé (94) sur un côté de la carte à circuit imprimé, l'emplacement de connexion (31) incluant un connecteur de déplacement d'isolant monté sur la carte à circuit imprimé (94) sur un côté opposé au ou aux récepteurs de connecteur (30), la plaque de face (92) incluant une ouverture pour exposer le ou les récepteurs de connecteur (30).
10. Panneau de raccordement de télécommunications (20) comprenant :
 - une pluralité de modules de connecteurs (32), chaque module de connecteurs ayant une face avant (37) et une face arrière opposée, chaque face avant incluant une pluralité de récepteurs de connecteur (30) définissant au moins un groupement linéaire, chaque face arrière incluant une pluralité d'emplacements de connexion de câble (31), les emplacements de connexion de câble reliés aux récepteurs de connecteur (30) pour transmission par ce biais des signaux de télécommunications, chaque module de connecteurs (32) définissant un axe

de rotation généralement parallèle à la face avant, les groupements linéaires des récepteurs de connecteur généralement perpendiculaires aux axes de rotation respectifs des modules de connecteurs ;

un cadre d'accueil (34) ayant une face avant (36) et un groupement linéaire d'ouvertures, chacun des modules de connecteurs (32) monté au cadre d'accueil (34) dans l'une des ouvertures pour un mouvement rotatif autour des axes de rotation respectifs.

11. Panneau de raccordement de télécommunications selon la revendication 10, où chacun des modules de connecteurs (32) est positionnable dans au moins une des trois positions pouvant être choisies, une première position où la face avant (37) du module de connecteurs (32) est généralement parallèle à la face avant (36) du cadre d'accueil (34), une première position orientée où la face avant (37) du module de connecteurs (32) est à un premier angle par rapport à la face avant (36) du cadre d'accueil (34), et une seconde position orientée où la face avant (37) du module de connecteurs (32) est à un second angle par rapport à la face avant (36) du cadre d'accueil (34) dans une direction opposée à la première position orientée.
12. Panneau de raccordement de télécommunications selon la revendication 10 ou 11, comprenant en outre des supports (34c, 34d) sortant du cadre d'accueil (34) pour un montage en rack (22).
13. Panneau de raccordement selon l'une quelconque des revendications 10 à 12, comprenant en outre un verrouillage (40) pour bloquer sélectivement le module de connecteurs au cadre d'accueil.
14. Panneau de raccordement de télécommunications selon la revendication 13, dans lequel au moins un verrouillage bloque deux modules de connecteurs adjacents au cadre d'accueil (34).
15. Panneau de raccordement de télécommunications selon l'une quelconque des revendications 10 à 14, dans lequel les récepteurs de connecteur sont dimensionnés pour recevoir des fiches de câbles de télécommunications en cuivre, et les emplacements de connexion de câble incluent des blocs de terminaison de fil configurés et organisés pour recevoir les fils des câbles de télécommunications en cuivre.
16. Panneau de raccordement de télécommunications selon l'une quelconque des revendications 13 à 15, et comprenant en outre un butoir (114) pour limiter la rotation de chacun des modules de connecteurs (32) à une gamme de mouvement prédéterminée.

17. Panneau de raccordement de télécommunications (20) comprenant :

une pluralité de modules de connecteurs (32), chaque module de connecteurs incluant au moins un groupement linéaire de récepteurs de connecteurs avant (30), chaque récepteur de connecteur (30) connecté à un emplacement de connexion arrière (31) ;
un cadre d'accueil (34) ayant une face avant définissant un plan avant (36), les modules de connecteurs (32) montés au cadre d'accueil (34), chacun des groupements linéaires des récepteurs de connecteur (30) définissant une ligne d'un premier récepteur de connecteur de groupement linéaire à un dernier récepteur de connecteur de groupement linéaire, chaque ligne placée à un angle par rapport au plan avant (36) de la face avant.

18. Panneau de raccordement de télécommunications selon la revendication 17, dans lequel les modules de connecteurs (32) sont montés en pivot au cadre d'accueil (34).

19. Procédé pour assembler un panneau de raccordement de télécommunications (20) comprenant :

fournir un cadre d'accueil (34) incluant une pluralité de modules de connecteurs (32), chaque module de connecteurs (32) ayant une face avant (37) et une face arrière opposée, chaque façade incluant une pluralité de récepteurs de connecteur (30) définissant au moins un groupement linéaire, chaque face arrière incluant une pluralité d'emplacements de connexion (31), les emplacements de connexion reliés électriquement aux récepteurs de connecteur (30), chaque module de connecteurs (32) définissant un axe de rotation généralement parallèle à la face avant (37), les groupements linéaires des récepteurs de connecteur généralement perpendiculaire aux axes de rotation respectifs ;
monter un câble à une de la pluralité d'emplacements de connexion (31) sur un des modules de connecteurs sélectionné (32) ;
monter un cordon de raccordement au récepteur de connecteur (30) sur le module de connecteurs sélectionné (32) connecté à l'emplacement de connexion monté au câble ;
débloquer le module de connecteurs sélectionné depuis une condition bloquée relative au cadre d'accueil (34) ;
faire tourner le module de connecteurs sélectionné par rapport au cadre d'accueil (34) à une position pivotée ; et
rebloquer le module de connecteurs sélection-

né dans une position pivotée relative au cadre
d'accueil (34).
